# **Abstract**

As the share of electricity from regenerative sources is growing constantly, the weather becomes an increasingly important factor in the analysis of electricity markets. Hence, this thesis uses local weather data to predict electricity spot prices. More precisely, we include wind speed and temperature from individual German weather stations into time series and statistical learning models. However, as the available weather information is vast and renewable power is not generated everywhere, we use random forests and Bayesian structural time series to perform a feature selection. Overall, we manage to improve our forecasting accuracy of the EPEX electricity prices by up to 7.69 % in terms of root mean squared error and up to 8.19 % in terms of mean absolute error.

# List of Figures

4.1. This figure shows the 2D boolean numpy.ndarray used to filter grid squares that are within germany. It was created by using a shapefile of germany (TODO insert source <a href="https://ec.europa.eu/eurostat/cache/GISCO/distribution/v2/nuts/nuts-2016-files.html">https://ec.europa.eu/eurostat/cache/GISCO/distribution/v2/nuts/nuts-2016-files.html</a> ) and checking for each point of the grid if it is within the shapefile. (TODO shorter explanation, put explanation in text) . . . . .	9
4.2. This figure shows a plot of the mean temperature in germany from 2015/1/1 to 2018/12/31 with one value per day at 12am utc time. . . . .	9

# List of Tables

2.1. List of related works and used methods respectively as well as some further details. . . . .	3
4.1. List of exogenous weather variables used to forecast the load including min, max values. . . . .	8

# **1. Introduction**

This work is supposed to refer about including grid-based data into load forecasts using different methods.

## 2. Related Work

When it comes to weather based prediction of power, a lot of papers have been published. Some of them also used data from ECMWF, but none of them had a focus on the aspect of grid-based data. So first of all it is important to filter out works that deal with grid-based data, as very often it is not directly mentioned.

<b>paper</b>	<b>grid-based</b>	<b>methods</b>	<b>used data</b>	<b>scope</b>	<b>year</b>
Sperati et al. (2016)	grid?!	PDF,NN,VD,EMOS,PE	ECMWF	short term	2016
De Felice et al. (2015)	grid?!	LR,SVM	ECMWF	medium term	2015
Alessandrini et al. (2015)	grid?!	methods?!	ECMWF	short term	2015
Aguiar et al. (2016)	grid?!	ARMA,NN	ECMWF	intra-day	2016
Fairley et al. (2017)	grid?!	methods?!	ECMWF	none?!	2017
Davò et al. (2016)	grid?!	methods?!	ECMWF		2016
Salcedo-Sanz et al. (2018)	grid?!	ELM,CRO,SVR,GGA	ECMWF	short term?!	2018
Voivontas et al. (1998)	grid?!	methods?!	SDHWS	none?!	2016
Aertsen et al. (2012)	grid?!	methods?!	not sure yet	none?!	2016

**Table 2.1.** List of related works and used methods respectively as well as some further details.

## **3. Methodology**

Using weather data from ECMWF Copernicus Climate Change Service (C3S).

Using load data from <https://data.open-power-system-data.org/>.

First downloaded whole Datasets from 2006-2019, but as the load for germany is properly available since 2015, now reduced dataset to 2015-2019.

Also checked for non-existing values, only 2 last timestamps values for the load are missing.

### **3.1. Method 1**

Maybe use Random Forests for variable selection as in Nicoles paper? (Ludwig et al. 2015)

You can also use equation numbering if you need to refer to an equation later e. g. Equation (3.1).

$$a^2 + b^2 = c^2 \quad (3.1)$$

Additionally, simple equations can be put inline with the text, for example,  $x \in X$ . Remember to set all variables in math font i. e. all  $x, i$  and so on.

### **3.2. Method 2**

...

## **4. Evaluation**

### **4.1. Research**

Searching information always is a key element in research. Therefor, arXiv and Google Scholar were used in order to find suitable reading.

It proofed to be difficult to find such papers using keywords such as "grid-based" or "geographic", because most of the results referred to either other grids, such as in Smart Grid, or completely different geographic research subjects.

As weather data from the ECMWF is used in this thesis, which is grid based, one solution was to search for "ECMWF", as this type of data is widely used within the research field of energy.

also used BASE which proposed "energy network geographic data" after searching a bit, I came to the term "energy network ecmwf" which gave some hits.

One criteria is the title which tells much about the subject of the work. If the title implies both, working with geographic or grid-based data and also has a connection to the field of energy networks, it might be suitable for this work.

Another one is the abstract and/or introduction which tells some more details about the paper. If there are some points about applying geographic data in algorithms to forecast some power production or demand, it is most likely that this paper contains some valuable information for this thesis.

### **4.2. Data**

#### **4.2.1. ECMWF**

The data used in this thesis originates from ECMWF, which is a research institute that produces global numerical weather predictions and other data.

It is time series based and for each timestamp there is a 2-dimensional array referred to by

#### 4. Evaluation

---

longitude and latitude respectively.

It must be mentioned that, as the data used has been reanalyzed, the expected error is likely to be smaller than if working with real-time data.

As data parameters there are also longitude and latitude, where the longitude is chosen to be from 5.5 to 15.5 and the latitude from 47 to 55.5. As the resolution of the used grid is at  $0.25^\circ$ , this results in a total of 1435 grid points per timestamp. As the range of the data from ECMWF extends from 2015/1/1 to 2019/3/31(TODO update), there is a total of 1551 days with each 12 timestamps due to the 2 hours frequency and thus 18612 timestamps. Considering that there is a value for each point in the grid and every timestamp, there are 26708220 values for each variable.

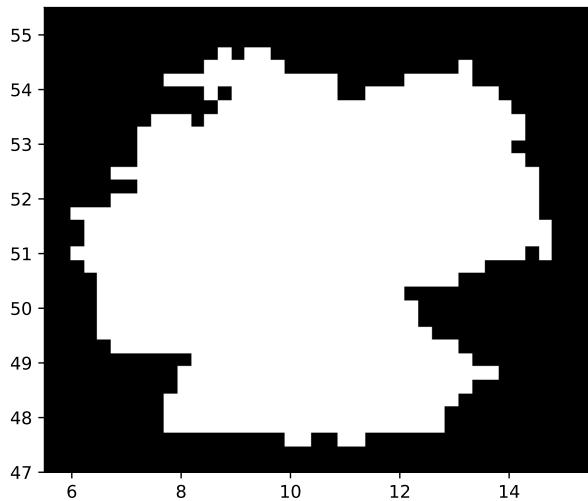

In order to reduce complexity, a shapefile of the NUTS dataset was used. The shapefile contains all countries in the EU. The shape of Germany was filtered from this data and each point in the ECMWF dataset is checked whether it is within Germany or not. The result can be seen in figure 4.1.

variable name	units	min	max
10 metre U wind component	$\text{m s}^{**-1}$	-18.56	21.92
10 metre V wind component	$\text{m s}^{**-1}$	-21.51	20.00
2 metre temperature	K	240.97	313.26
Leaf area index, high vegetation	$\text{m}^{**2} \text{m}^{**-2}$	0.00	4.90
Leaf area index, low vegetation	$\text{m}^{**2} \text{m}^{**-2}$	0.00	3.84
Low cloud cover	(0 - 1)	0.00	1.00
Soil temperature level 1	K	257.91	313.64
Surface latent heat flux	$\text{J m}^{**-2}$	-2203977.00	359411.00
Surface net thermal radiation	$\text{J m}^{**-2}$	-663417.00	142945.02
Surface sensible heat flux	$\text{J m}^{**-2}$	-1703159.00	801354.00
Total cloud cover	(0 - 1)	0.00	1.00
Total column rain water	$\text{kg m}^{**-2}$	0.00	2.73
Total sky direct solar radiation at surface	$\text{J m}^{**-2}$	-0.12	3088320.00

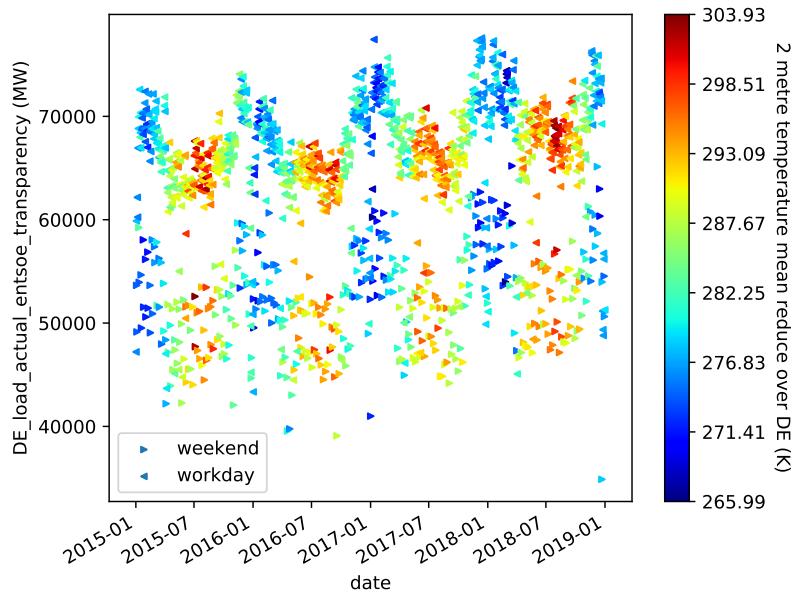

**Table 4.1.** List of exogenous weather variables used to forecast the load including min, max values.

#### 4.2.2. Load data

Table 4.1 is an example table. Remember to use full sentences in your caption and explain everything one can see in the table there as well. You can of course also use a simpler format for your table.

**Figure 4.1.** This figure shows the 2D boolean numpy.ndarray used to filter grid squares that are within germany. It was created by using a shapefile of germany (TODO insert source <https://ec.europa.eu/eurostat/cache/GISCO/distribution/v2/nuts/nuts-2016-files.html>) and checking for each point of the grid if it is within the shapefile. (TODO shorter explanation, put explanation in text)

**Figure 4.2.** This figure shows a plot of the mean temperature in germany from 2015/1/1 to 2018/12/31 with one value per day at 12am utc time.

## 4.3. Programming part

### 4.3.1. Programming Language

For the programming part, Python3.6+ has been chosen, as there is a variety of libraries to process all used file formats and because it tends to be a time saving language, also for visualization.

### 4.3.2. Documentation

In regard to coding styles, especially when it comes to docstrings, the numpy conventions were used. The three major points for this were first, that it is a popular and often used style, then it is also a visually oriented style which means, that it is easy to read and last it is supported by several (TODO check which, sphinx?!) autodoc tools that create a HTML based documentation from existing source code with docstrings.

## 4.4. Results

Describe the results you have obtained using your methods described above. Again use proper visualization methods.

### 4.4.1. Experiment 1

...

### 4.4.2. Experiment 2

...

## **5. Discussion**

This chapter is supposed to discuss your results. Point out what your results mean. What are the limitations of your approach, managerial implications or future impact? Explain the broader picture but be critical with your methods.

## **6. Conclusion**

Repeat the problem and its relevance, as well as the contribution (plus quantitative results).

Look back at what you have written in the introduction.

Provide an outlook for further research steps.
